

# Pre-push, Make, and env checklist

Before you push or hand off a build, run a short local checklist

# Status, env, then the green build

- Git status shows uncommitted noise, commit or stash before push
- A short log confirms what you are about to send
- Tools often need a TOOLS path or env file
- Prefer dry-run cleans when unsure
- Exit zero is the handshake CI and teammates expect

# Browser lab

[illegible]

## Workflow lab

# Real shell practice

```
wsl - module23-workflow/examples/pre_push_checks

# Track A - real Unix

# real shell session (Track A)

$ # demo: tiny clean Git repo (stand-in for your project)
/tmp/m23_workflow_c75Dtl

$ chmod u+x check_ready.sh

$ ./check_ready.sh
=== git status ===

=== Last 3 commits (what would be pushed) ===
fe2732f initial commit

Working tree clean. Consider: git pull, then git push.

$ which make
/usr/bin/make

$ make --version | head -n 1
GNU Make 4.3
```

Real shell — check\_ready

## Real shell practice — try these

```
# chmod u+x check_ready.sh — make the pre-push helper executable
chmod u+x check_ready.sh
```

```
# ./check_ready.sh — status + recent log; exit 1 if dirty (run from a
Git repo)
./check_ready.sh
```

```
# which make — confirm Make is on PATH
which make
```

```
# make --version — one-line toolchain sanity check
make --version | head -n 1
```

# Pitfalls to watch

- Do not push with a dirty tree and hope CI sorts it out
- Do not blame the RTL when TOOLS or env was never sourced
- And remember

# Your turn

- Complete the checklist for at least one track, preferably both
- In the browser, clear a few challenges after the starter
- On the real shell, run check-ready from a clean tree and confirm Make is available
- When you are ready, take the short quiz, then continue to Makefile basics
