

Unix path complete

You have walked the Unix path for design work

What you can do now

- You can navigate and inspect a project from a shell
- You can use pipes, jobs, and basic scripts with a dry-run-first habit
- Triage a failed Make or sim log before rewriting RTL
- That foundation is what every later chip course assumes

Close the track gaps

- The scripting modules so paths and scripts feel natural
- If you mainly used a real terminal
- Either track works for self-study; both together stick best before Git

The tools you practiced

- Here is the tools index again, the same shelf of concept labs you opened along the way
- You do not need to re-clear every challenge
- Use it as a map

Next: learn Git

- Git sits on the same real shell muscle you just built, status, diffs, commits
- Start learn Git from the syllabus when your checklist for this wrap feels honest
- Keep a practice tree under your home directory

Your turn

- Review the wrap checklist
- Confirm you can explain absolute versus relative paths and why globs expand before the
- Keep a practice tree you can reuse
- When you are ready, take the short quiz, then continue to learn Git
